

Heuristic: Recommendations for Doctors Without Borders Website

The Doctors Without Borders website is well-designed and user-friendly, with strong adherence to real-world conventions and minimalist design principles. However, there are opportunities to improve feedback mechanisms, user control, and error handling to enhance the overall user experience

1. Improve Feedback Mechanisms:

- Provide immediate feedback after primary actions (e.g., confirmation messages after signing up for updates or completing a donation).
- Indicate system delays or progress during tasks (e.g., loading indicators).

2. Enhance User Control:

- Introduce an "undo" functionality, especially for critical actions like donations.
- Allow users to cancel operations in progress (e.g., cancel button during the donation process).

3. Refine Error Handling:

- Avoid using exclamation points in error messages to maintain a calm and constructive tone.
- Consider adding sound signals for critical errors, but ensure they are optional and not intrusive.

4. Address Consistency Issues:

- Align integers and real numbers consistently across the website.
- Reduce the use of full capital letters in buttons to improve readability.

5. Optimize Navigation:

- Ensure breadcrumbs are available on all pages to help users navigate back easily.
- Allow users to change earlier menu choices when navigating through multi-level menus.

By addressing these issues, the website can better serve its diverse user base and achieve its mission of engaging users in humanitarian efforts.
